WORLD AIDS DAY 2012

New HIV infections
- Worldwide, 2.5 million [2.2 million–2.8 million] people became newly infected with HIV in 2011.
- 25 countries have seen a 50% or greater drop in new HIV infections since 2001.
  - There has been a 42% reduction in new HIV infections in the Caribbean (the second most affected region in the world after sub-Saharan Africa).
- Half of all reductions in new HIV infections in the last two years have been among newborn children—showing that elimination of new infections in children is possible.
  - In 2011, new infections in children were 43% lower than in 2003, and 24% lower than 2009.
- However progress is uneven. Since 2001, the number of people newly infected in the Middle East and North Africa increased by more than 35%. In Eastern Europe and Central Asia, there has also been an increase in new HIV infections in recent years.

AIDS-related deaths
- In 2011, 1.7 million [1.5 million–1.9 million] people died from AIDS-related causes worldwide—24% fewer deaths than in 2005.
  - Globally there were more than half a million fewer deaths in 2011 than in 2005.
- The number of AIDS-related deaths declined by nearly one-third in sub-Saharan Africa between 2005 and 2011.
  - The Caribbean experienced declines in AIDS-related deaths of 48% between 2005 and 2011 and Oceania 41%.
  - However two regions experienced significant increases in AIDS-related deaths; Eastern Europe and Central Asia (21%) and the Middle East and North Africa (17%).

Antiretroviral therapy
- In 2011, more than 8 million people living with HIV had access to antiretroviral therapy.
  - The number of people accessing HIV treatment increased by 63% from 2009 to 2011. In 10 low- and middle-income countries, more than 80% of those eligible are receiving antiretroviral therapy.
- However, 7 million people eligible for HIV treatment still do not have access.
  - 72% of children living with HIV who are eligible for treatment do not have access.

People living with HIV
- In 2011, there were 34 million [31.4 million–35.9 million] people living with HIV.
Sub-Saharan Africa is the region most affected, with nearly 1 in every 20 adults living with HIV.

Sub-Saharan Africa accounts for 69% of all people living with HIV.

**HIV/TB**
- TB-related deaths in people living with HIV have fallen by 25% since 2004.
- However, TB remains the leading cause of death among people living with HIV.
- All people living with both TB and HIV should start antiretroviral therapy immediately as it can reduce the risk of TB illness among people living with HIV by up to 65%.
- However in 2011, fewer than half (48%) of people with TB who had a documented HIV positive test result obtained antiretroviral therapy.

**Women**
- Of the 54% of people with access to antiretroviral therapy in low- and middle-income countries, 68% were women.
- Women account for 58% of people living with HIV in sub-Saharan Africa.
- In 26 of 31 countries with generalized epidemics, less than 50% of young women have comprehensive and correct knowledge about HIV.

**Key populations**
- Among countries with generalized epidemics, HIV prevalence is consistently higher among sex workers in the capital city than in the general population, at around 23%.
- Around 3 million of the estimated 16 million people who use drugs are living with HIV.
  - In 49 countries with available data, HIV prevalence was 22 times higher in people who use drugs than in the general population.
  - One study suggests that globally people who inject drugs only use sterile injecting equipment for 5% of injections.
- HIV infection among men who have sex with men in capital cities is on average 13 times higher than in the general population.
- In low- and middle-income countries with available data, 91% of total spending on HIV programmes for sex workers comes from international sources; as does 92% of spending on HIV programmes for men who have sex with men and 92% of spending on HIV programmes for people who inject drugs.

**Investments**
- US$ 16.8 billion was available from all sources for the AIDS response in 2011.
  - Only a 30% gap in resources remains for fully funding the AIDS response by 2015
  - The estimated annual need by 2015 is between US$ 22-24 billion.
- Low- and middle-income countries increased HIV investments by 15% from 2010 to 2011.
  - Domestic public and private spending in low- and middle-income countries rose from US$ 3.9 billion in 2005 to almost US$ 8.6 billion in 2011.
